28 September 2026

Dear Hiring Team,

I'm applying for an application security role on your team. I have spent the last two and a half years at MoveInSync, first as an application security intern and, since June 2025, as a cyber security engineer, testing web, API, and Android/iOS products and building the tools that make that testing faster.

In FY2025–26 I reported 156 VAPT findings across 10 internal test cycles, 42 of them Critical, including broken access control, IDOR, and unauthenticated API exposure. I map each finding from CVSS to a fix SLA and follow it through with engineering, and about 93% of the tickets assigned so far are closed. I also run external VAPT with four outside vendors: filtering their false positives, agreeing on compensating controls, and revalidating fixes before enterprise audits.

Much of my time goes into tooling. I built a 9-phase Android DAST framework that cut per-app testing from 1–2 days to under an hour; GQLSweep, a Burp extension that runs 170+ GraphQL checks from one right-click; and a Burp extension that decodes a proprietary compressed mobile protocol so its traffic can be actively tested. I have published the Android and iOS frameworks as TrashDroid and TrashiOS on GitHub.

I have also led incident response. For a CI/CD server intrusion, I reconstructed the attack from on-host artifacts, traced three separate attacker visits, and wrote the hardening worklist for the rebuilt host. I then drove the credential-exposure response, where read-only checks caught keys that had been reported as rotated but were still live.

Before MoveInSync I did bug bounty and responsible disclosure, with Hall of Fame recognition from Mastercard and Rakuten and 20+ NCIIPC India acknowledgments. I hold eWPTXv2 and CompTIA Security+.

I would welcome the chance to talk about how I can help your team find and fix security issues earlier. My resume is attached, and more of my work is at [github.com/somchandra17](https://github.com/somchandra17).

Sincerely,

Som Chandra
